Composer setup

1. Composer setup

This page covers the composer setup.
Composer is used to install the needed php dependencies for his php project.

composer.json

```
{
  "require": {
    "apache/log4php": "2.3.0",
    "cboden/ratchet": "^0.3.3",
    "propel/propel": "~2.0@dev"
  },

  "autoload": {
    "classmap": [
      "../db/model/"
    ]
  }
}
```

The **require** section holds the libraries which are used by this php project.
The **autoload** section holds the resources which get loaded via composer provided autoload mechanism.
